MAIN LINES OF RESEARCH

The Urology Clinical and Basic Research group has been an associated group of IIB Santpau since its very beginning. The group carries out clinical translational research within the field of urinary tract diseases along different lines from urological cancer, functional urology, stone disease, paediatric urology, renal transplant and reconstructive surgery.

Existing lines of research are:

In the area of urological cancer, Dr. Breda is leading several projects mainly related to liquid biopsy in urothelial and prostate cancers, focal treatment of prostate cancer, methodology in enhancing lymph nodes in prostate and upper urinary tract disease, intraoperative detection of tumour grade with confocal endomicroscopy in order to facilitate clinical decisions and avoid unnecessary procedures, the role of systemic chemotherapy in upper urinary tract tumours and the role of PET-CT in renal masses and 3D reconstruction in order to facilitate complex renal surgeries. In testis cancer we are evolving to minimally invasive surgery with robotic retroperitoneal dissection in metastatic disease and finally diagnoses using the sentinel node technique in penile cancer, and also reconstructive surgery after partial penectomy plus laparoscopic lymphadenectomy of the groin.

Dr. Palou is leading mainly the projects in bladder cancer: there is a collaborative translational research line of predictive biomarkers in NMIBC progression with the Inflammatory Group and Malmoe University. Bladder preservation in high grade tumours is a difficult decision and the possibility to detect those who will progress will allow earlier aggressive treatment. Another line of research is the nerve sparing surgery in cystectomy in order to preserve sexual function after radical surgery.

In paediatric urology, led by Dra. Bujons, there are several topics under research related to long term follow-up in reconstructive surgery, sexual function in neurological diseases and fertility in patients after scrotal surgery (varicocele, orchidopexy). This includes the study of the usefulness of Botuline toxine in hyperactive bladder in children, PH urine studies for the risk of infection in urinary tract anomalies, optimisation of irrigation fluids for the prevention of unnoticed perioperative hypothermia in children during RIRS and NLP and the Autologous fat graft with stem cells as a treatment for abdominal wall defects in patients with complex exstrophy epispadias.

In the Urolithiasis line chaired by Dr. Angerri, clinical research in some aspects is performed: laser energy devices for stone destruction (holmium, thulium, superthulium) in collaboration with IIBSantPau General and Digestive Surgery Group for primary hiperparatiroidism, tolerance of surgical material for urolithiasis treatment and pH urine research for the management of cystinuria. In cystinuria, there exists an extensive collaborative research with IDIBELL for its genetic study and an active participation in the National Registry of this Rare Disease.

The functional urology section by Dr. Errando is evaluating the clinical results of different surgical techniques and devices in incontinence in both sexes such as paraurethral substance injections, laparoscopic colposacropexy technique, long term functional results of Botox in males, functional results of the transcavernous artificial urinary sphincter implantation in high risk patients, usefulness of probiotics in the prevention of recurrent urinary tract infections, acidification of urine pH for women with recurrent UTIs. A quality of line research collaboration with the Centre de Fisioteràpia (RAP) in Barcelona (associated to the UAB Vall d'Hebron) in clinical apps for patients has been recently begun.

Renal transplantation unit by Dr. Breda is investigating 3D reconstruction models to facilitate renal transplant for a better preservation of the kidney. The group is establishing the robotic renal transplant all over Europe and undergoing analysis of the urogenital tumours in renal transplant patient in order to update and change daily practice.

BPH surgery is one of the most common in urology and the group of Dr. Ponce de Leon is investigating the way to perform surgery with preservation of anterograde ejaculation with different methodologies (TURP, Rezum). The group also study the use of the Rezum system (intraprostatic vaporization) in BPH, the quality of life of patients who had undergone urethroplasty due to urethral stenosis, the use of oral mucosa for urethroplasties. A recent national collaboration for an Urethroplasties Registry has recently begun.

Mrs Vanessa Muñoz and the nurse Ana Palomino are the coordinators of clinical studies and trials. They are key pieces to continue with the ongoing studies of the department.

SCIENTIFIC CHALLENGES
